There are three different peering relationships available within the International IC-SMS community. The type of peering relationship determines the level of reach capability of the carrier:

2-way reach: This allows full two-way capability (MO and MT)

1.5-way reach: This allows a message to be sent by your subscriber and the party receiving the message to send a reply. The receiving subscriber cannot initiate a message

1-way reach: This allows a message to be sent by your subscriber, but the receiving subscriber cannot reply to or initiate a message.
